

Peer Review, Feedback, and Collaboration

Patricia Quigley's feedback focused on the clarity of the pre-class instructions, the design of the readiness assurance questions, and the application activities. The screenshots show the changes I made in response, followed by a brief explanation of how I addressed each recommendation. The final section provides evidence of the feedback I gave on her lesson.

Feedback from Patricia

- Introduction section
 - I like how you have included the pre-reading resources in the Introduction section.
 - You have included a number of formats to suit a variety of learning preferences and there is the option to do more in-depth preparation thanks to the journal articles that you have added.
 - Perhaps include an instruction that indicates what resources are required before class.

I added instructions beneath each resource in Moodle to clarify what learners were required to complete before class.

Feedback from Patricia

- IRAT/TRAT questions
 - Questions 1 to 4 are general and serve as good testing questions

- Question 5 could be a specific situational response question. I would consider adding a situational response question to the IRAT/TRAT

5. No clear policy?

An instructor suspects students are using AI in ways that undermine their learning outcomes, but has no clear policy in place. Which approach best aligns with the AI Assessment Scale philosophy?

Choose one of the following answers.

- ☐ Ban all AI use across the course to eliminate ambiguity
- ☐ Add a blanket statement to the syllabus that students must "use AI responsibly"
- ☐ Report suspected AI use to academic integrity officers immediately
- ☐ Review each assessment's learning outcomes and assign an AI level that makes unauthorized use either irrelevant or transparent

How confident are you of your answer?

0% 50% 100%

I added a situational question to the iRAT/tRAT that requires learners to apply their understanding of the AI Assessment Scale to a realistic instructional decision.

Feedback from Patricia

- Application Exercise: What Level is This?
 - This is a very effective application activity and will generate lots of discussion between the team members. It includes a good range of relatable situations too. I'm wondering if there is merit in including a justification text box?

I agreed that asking teams to justify their choice would strengthen the activity by making their reasoning visible. I was unable to identify a way to add a justification textbox within this LAMS activity, so I did not implement this recommendation. This could easily be incorporated into the discussion following the exercise.

Feedback from Patricia

- Application Exercise: How would you say it?
 - I love this activity. Simple, clear in its expectations and at the same time providing opportunities to students to be ambitious with their responses. The competitiveness element of the class voting on the clearest and most complete will work really well.

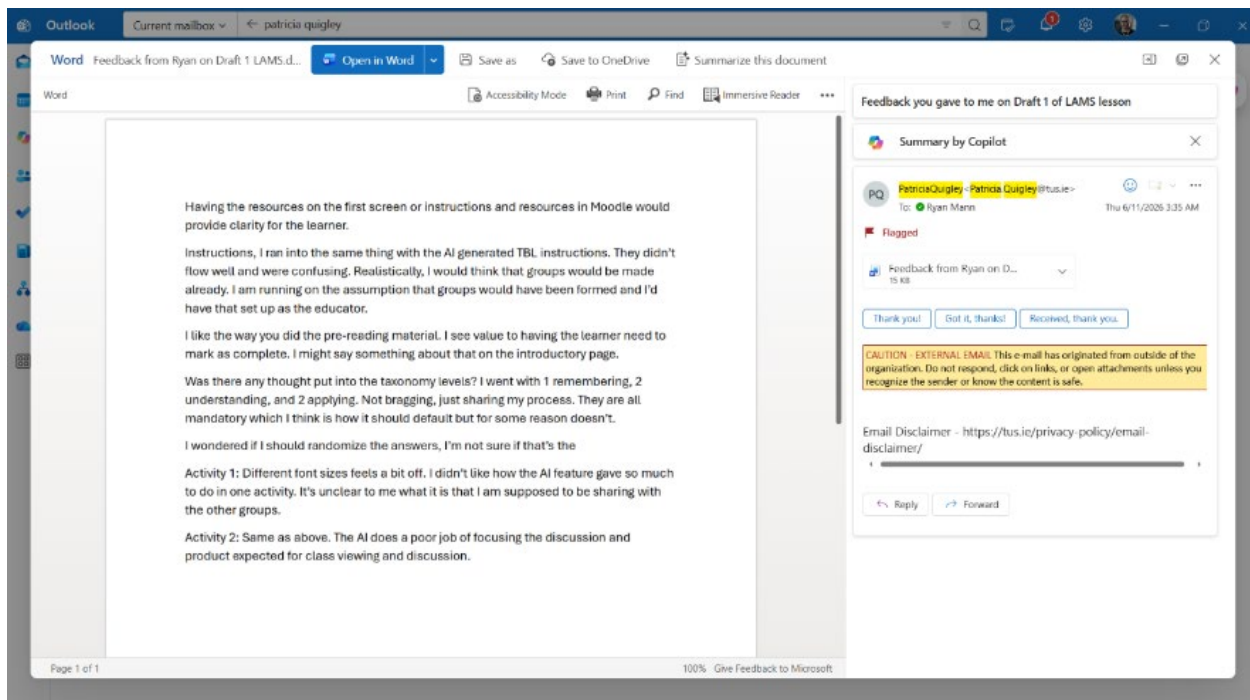

No revisions were required for this exercise. Gold Star!

Feedback from Patricia

- Well-designed clear introduction lesson to AI use in assessments. Well done!

Feedback from Ryan

My feedback on Patricia's lesson started with suggesting that the resources could be placed in Moodle and the instructions provided in LAMS. I pointed out that the pre-reading materials provided useful background on the topic. I also considered whether the first activity was intended to assess readiness or support reflection and suggested reviewing its alignment with the intended purpose. For the application activity, I identified the value of the clear directions and practical examples while offering suggestions for supporting the learner experience.

Reflection on Peer Review

Exchanging feedback provided an opportunity to view my lesson from another educator's perspective and identify elements that were not as clear to someone encountering it for the first time. Patricia's feedback resulted in two direct revisions: clearer instructions for the pre-class resources and the addition of a situational question to the readiness assurance process. Her suggestion to include a written justification also identified a worthwhile improvement, even though I was unable to implement it within the current LAMS activity. Reviewing Patricia's lesson was also valuable because it required me to consider the alignment among preparatory resources, instructions, activities, and the intended learning. Together, the feedback given and received reinforced the value of peer review as part of an iterative design process.
